

Final Project Proposal

Krzysztof Drewniak, Alex Irlon, and Tony Sampson

2017-04-08

We propose to develop a tool sends spoofed email's with

1. Given an email address, we will create a spoofed email that will then be sent out to the targeted address.
2. When the victim of the attack opens the spoofed email a cross site script will be part of the email that will retrieve the session id of the user.
3. With the session ID of the victim we will then Hijack the victims session
4. With the Hijack session we will retrieve the contents of the account.
